

/*Day 69 coding Statement : Suppose,

we have a class A which is the base class and we have a class B which is derived from class A and

we have a class C which is derived from class B, we can access the functions of both class A and class B by creating an object for class C.

Hence, this mechanism is called multi-level inheritance. (B inherits A and C inherits B.)

Create a class called Equilateral which inherits from Isosceles and should have a function such that the output is as given below.*/

```
class A{

}

class B extends A{
    public void m(){
        System.out.println(" I am an equilateral triangle");}
}

class C extends B{
    public void m1(){
        System.out.println("I am an isosceles triangle I am a triangle");}
}

public class Main
{
    public static void main(String[] args) {
        C obj=new C();
        obj.m();
        obj.m1();
    }
}
```
